

Rooftop Fall Protection For Restaurants

Maintaining the various equipment on restaurant rooftops can be risky, especially if there is no fall protection in place. Workers are exposed to fall hazards every time they service the various units, vents and signage. If a worker falls while on the rooftop, the restaurant will be subject to OSHA fines, lawsuits and medical bills.

Keep your workers safe by installing a complete fall protection system. HySafe's rooftop solutions are versatile, cost effective and comply with OSHA 1910.28(b)(13), allowing your employees to work safely at heights.

Nonpenetrating Rooftop Solutions

Guardrail

HySafe's guardrail is the perfect solution for those who prefer a nonpenetrating system. With our guardrail, you can rest assured there will be no roof leaks or damages and can be retrofitted to any building. This cost-effective solution is available as either freestanding or modular, allowing you to choose the right style for your rooftop. Its lightweight frame reduces the load on the roof as well as makes it much easier to move. With various colors and lengths available, you can customize the guardrail to match your rooftop for aesthetics and low visibility.

Heavy Weight Anchor

Similar to our guardrail system, the HySafe Heavy Weight Anchor is nonpenetrating, which ensures no leaky rooftops or damages. Designed only for flat rooftops, this solution has anti-skid base plates and a swivel bracket that can connect to any self-retracting lifeline which allows 360-degree rotation. This solution is ideal for rooftops with infrequent maintenance and can easily be transported and assembled by one person. Sixteen 50-pound plates assemble into a steel frame to create the 825-pound anchor. Additional weighted bases and colors available.
